The **Product Type Attribute** will pull the type of an item you are searching. For example, if you were to type in pants, all the products that are classified as pants in your Shopify inventory will be loaded.

If you would like to pull inventory that was created after a specific date, you can use the **Created After Attribute**. When putting in dates for attributes, always do it as YEAR-MM-DD. For example, if you wanted to pull items from your inventory that was created after October 23 of 2021, you would select Created After attribute and type in 2021-10-23.

The screenshot displays a web interface with a 'Load Inventory' modal window. The modal contains the following elements:

- Dropdown menu: created_before
- Date input field: 2021-11-20
- Red 'X' button
- Blue '+ Add Additional' button
- Blue 'Load Inventory' button

The background shows a product listing for 'OVAL Size 22 Black & White Abstract Print Tank Top Dress (Petite) (Cotton Blend)'. The product details are as follows:

Condition	Size	Color
Used	22	Black
Price	Type	Brand
30.00	Dress	Oval Clothing

If you would like to pull inventory that was created before a specific date, you can use the **Created Before Attribute**. For example, if you wanted to view products that were created before November 20 of 2021, you would select the Created Before attribute and type in 2021-11-20.

The **Updated After Attribute** would pull inventory based on the most recent date an attribute for that item was updated. For example, say you created an item on October 23 of 2021 but changed the price of the item on November 1 of 2021, the created after date would be 2021-10-23 whereas the updated after date would be 2021-11-1. This would be the same for the **Updated Before and Created Before Attributes**.

With the **Price Range Attribute** you can select items that are between a specific price range. For example, if you wanted to pull items that only range between \$75 and \$1000, then you would select price range, type in 75 for the minimum and 1000 for the maximum. If you wanted to pull all items over \$75, input 75 next to minimum and leave the maximum empty. Conversely, you can leave the minimum empty and input a maximum value as well.

It's important to **use the attributes together**. The more attributes you use, the less inventory that will load and the faster the system will perform. For example, if you wanted to pull pants that were created after October 23 of 2021 and before November 20 of 2021, that ranged at a price of \$80-200, then you would select product type and type in pants, then select add additional and press on the created after attribute and type in 2021-10-23 then select add additional, and select created before and type in 2021-11-20, and select add additional one last time and select the price range attribute and type if 80 for min and 200 for max.
